

### GENERAL DESCRIPTION

The SGM90800A is an analog front end (AFE) designed for precise digital power monitor with an I<sup>2</sup>C or SMBus-compatible digital interface. The device provides bus supply voltage, shunt voltage and internal temperature monitor. The internal high resolution ADC, with flexible configurations including calibration value, conversion times as well as average numbers support direct fetch of current values in amperes and power values in watts.

The SGM90800A can measure a differential input voltage of  $\pm 163.84\text{mV}$  with common-mode voltage from 0V to 120V while the shunt voltage measurement pins IN+ and IN- can survive under a wide common voltage from -10V to 120V. The bus voltage measurement supports the range from 0V to 120V or 0V to 85V. The integrated temperature sensor has  $\pm 1^\circ\text{C}$  (TYP) accuracy for die temperature measurement, which is useful in the system level temperature calibrations.

With low offset and drift design of the SGM90800A, it is suitable for applications under wide range of temperature variation and simplifies the calibration. These features also make the device suitable for precise sensing systems. Two shunt voltage input ranges help expand the current measurement range.

The SGM90800A is available in a Green MSOP-10 package.

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.
