

SGM41566A/SGM41566B Linear Regulation Battery Charger

GENERAL DESCRIPTION

The SGM41566A and SGM41566B are designed for charging low capacity battery cell with factory-programmable current programmable in the range of 50mA to 750mA from loosen regulated power source. The device features low drop-out constant-current constant-voltage charging, weak battery pre-charging, voltage fold-back safe retaining, floating charging protection and system start-up pre-charge, with NTC sensing protection.

The SGM41566A and SGM41566B are available in a Green TDFN-2×2-8AL package. It operates in -40°C to +125°C junction temperature.

FEATURES

- Loosen Regulated Power Input
- Battery Voltages Option:
 25mV Raster in 3.5V to 4.8V Range
- Charging Current Option:
 50mA Raster in 50mA to 750mA Range
- 5% to 25% Residual End-of-Charge Option
- Weak Battery Pre-Charge Option
- Voltage Fold-Back Safe Power Retaining
- NTC Temperature Sensing for Protection
- Floating Charging Protection
- 650ms Power Recycle Certification
- Exhausted Battery Charging Inhibition
- Pre-Charging Power-Up at Normal Voltage
- Available in a Green TDFN-2×2-8AL Package

APPLICATIONS

Low Capacity Rechargeable Battery Powered Applications

TYPICAL APPLICATION

MARKING INFORMATION

NOTE: XXXX = Date Code, Trace Code and Vendor Code.

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

IN to GND	0.3V to 28V
IN Clamp Current or Voltage (1)	10mA or 28V
BAT to GND (When V _{IN} > V _{BAT})	0.3V to 20V
BAT to GND (When V _{IN} ≤ V _{BAT})	0.3V to 4.8V
TSEN to GND	
TSEN Clamp Current or Voltage (1)	0.3mA or 6V
Package Thermal Resistance	
TDFN-2×2-8AL, θ _{JA}	95°C/W
TDFN-2×2-8AL, θ _{JB}	47°C/W
TDFN-2×2-8AL, θ _{JC(TOP)}	84°C/W
TDFN-2×2-8AL, $\theta_{JC(BOT)}$	9°C/W
Junction Temperature	+150°C
Storage Temperature Range	65°C to +150°C
Lead Temperature (Soldering, 10s)	+260°C
ESD Susceptibility	
HBM	8000V
CDM	1000V

RECOMMENDED OPERATING CONDITIONS

Supply Voltage Range	2.9V to 19.5V
IN Clamp Current or Voltage (1)	10mA or 19.5V
TSEN Clamp Current or Voltage (1)	0.3mA or 5.5V
Input Effective Capacitance, C _{IN}	0.1µF to 12µF
Output Effective Capacitance, C _{BAT}	1µF to 12µF
Operating Junction Temperature Range	ge40°C to +125°C

NOTE:

1. The current limit and voltage limit are set for those values which applies onto the IN or TSEN pin current and voltage source for 10 minutes and should not cause any change to key operation parameters.

SGM41566A/SGM41566B

Linear Regulation Battery Charger

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

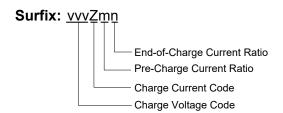

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all

integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

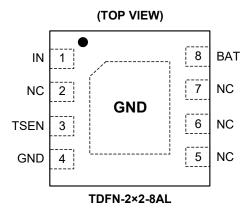

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATION

PIN DESCRIPTION

PIN	NAME	TYPE	FUNCTION
1	IN	Р	Charge Power Input for Powering this Device and Feeding to the Charge Output. The capacitor with effective capacitance in the range of $0.1\mu F$ to $12\mu F$ is recommended. It should be placed close to this pin for decoupling.
3	TSEN	Ю	Temperature Sensing and Enable Input. The external connection to this pin is checked, once power input voltage is in the effective range by feeding current (38.6µA) out of the pin. If the pin voltage is less than V_{ENL} (102mV), it is considered as being grounded. The charging function is disabled while the feeding current is reduced to about 25.5µA. If the pin voltage is higher than V_{ENH} (2.68V), charging function is enabled. If the pin voltage is between V_{ENL} and V_{ENH} , it is considered that the NTC thermistor is connected, and the ground resistance is evaluated for temperature safe charging. In this case, charging is allowed, only when the pin voltage is within the range of hot threshold resistance related voltage V_{HOT} to cold threshold related voltage V_{COLD} . The feeding current biases the pin voltage to be higher than V_{COLD} but less than V_{ENH} . If pin voltage in this range is found, it is considered to be excessive cold condition or NTC connection open, charge function is disabled.
4	GND	G	Ground of the Circuit.
8	BAT	0	Output to the Battery and/or System Load for Charging and/or Powering the System Load. The output decoupling capacitor with effective capacitance in the range of $1\mu F$ to $12\mu F$ is recommended. The pin sinks about $4\mu A$ if the pin voltage is higher than charging voltage, and the pin sinks about $1.5 mA$ if output clamp is triggered.
2, 5, 6, 7	NC	NC	No Internal Connection.
Exposed Pad	GND	_	Exposed Pad. Exposed pad is internally connected to GND. Connect it to a large ground plane to maximize thermal dissipation.

NOTE: P = power, IO = input and output, G = ground, O = output, NC = no connection.

ELECTRICAL CHARACTERISTICS

(Typical values are characterized at T_J = +25°C, limits are guaranteed in T_J range of -40°C to +125°C by design and product characterization statistical estimation, unless otherwise noted.)

Fold-Back Termination Temperature	TTERM	V _{CHG} or I _{CHG} falls to 0.5V o	or 0.5mA		150		°C	

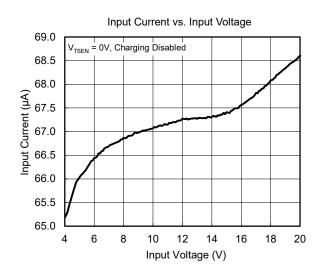

NOTES:

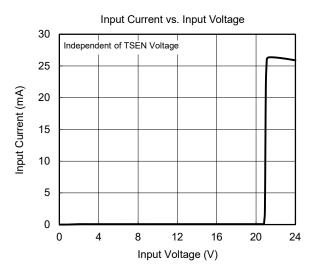

- 1. Forced leakage may occur when temperature is higher than +85°C for battery over-voltage free.
- 2. V_{IN} V_{BAT} need more than 95% × I_{CHG} × R_{ON} when I_{CHG} > 200mA.
- 3. Both charge voltage and charge current are designed to drop in the temperature range over $+130^{\circ}$ C and either charge voltage or charge current drops to zero by T_{FOLD} .
- 4. Timings may vary beyond the limits over +85°C but functionality keeps.
- 5. Guaranteed by design and characterization. Not production tested.

FUNCTIONAL BLOCK DIAGRAM

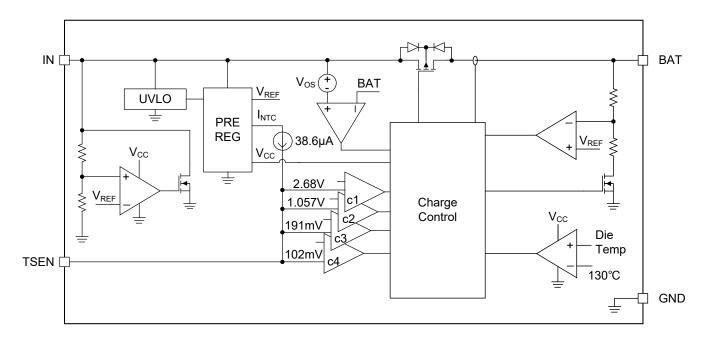

Figure 3. Block Diagram

DETAILED DESCRIPTION

The SGM41566A and SGM41566B are the constant-voltage and constant-current profile charge regulator with the input condition check. It features with input clamp, output clamp, die temperature regulation, NTC temperature-oriented protection and floating charging protection. As shown in Figure 1, there are only few external components desired. Figure 2 shows the illustrative charge profiles.

Exhausted Battery Charging Inhibition

If the voltage at BAT pin is below V_{INH} once the charging input is applied on the IN pin, the charging does not start, which assures no risk charging to an exhausted battery.

Wide Charge Available Input Range

Charging is kept when the input voltage is higher than the nominal input range, or when the supply cannot keep voltage and current stable. The charge current is regulated to prevent over-heating when the input voltage is at the higher range end, and it keeps conduction and maintains minimum forward drop-out when the input voltage is at the lower range end. It can charge from pulse train input such as half-sine wave of rectified AC and slow change source like solar cell photo-voltage, while it keeps charge state flags until the internal bias losses or the input stays low for long enough.

Voltage Fold-Back Power Retaining

When the end-of-charge condition is certified, it lowers the output to the safe voltage V_{FCHG} , while keeping the current limit at the level of normal charge and retaining power to the load system. The design avoids frequent discharging and recharging cycling in the situation that charge supply is always attached.

Minimum Floating Charge Time

When the charging current with high system load that sinks more than the residual end-of-charge current and the battery voltage stays higher than the floating charge voltage for over t_{FLT} duration, the battery will stop charging and enter the end-of-charge fold-back power retaining state. As a weak source, it may also cause the current to fall to less than the residual end-of-charge current, and minimum floating charge time > $t_{\text{FLT}}/2$ is a part of condition for full-of-charge certification.

Over-Temperature Charge Regulation

The device senses the die temperature. The thermal fold-back function starts to reduce the charge current when the internal temperature reaches the typical value of +130°C.

BAT Over-Voltage Protection

When any leakage or transient pulls V_{BAT} higher than 104% × V_{CHG} in charge, the BAT sinks current with 1.5mA clamp current for protection.

Full-of-Charge and Input Clamp

When the full-of-charge is certified, the input I_{IN} drops low and the output voltage steps down from V_{CHG} to V_{FCHG} . The sudden current changes the signals to the source side for turning into the full-of-charge state, and the source side can read the state by checking the output voltage or current. In case of wireless or contactless charging with high open load voltage, the device clamps its input voltage to about 21V with 26mA sinking.

NTC Temperature Sensing and Enable

The TSEN sources current (38.6 μ A) is used to read ground resistance for temperature-oriented protection. A grounded NTC thermistor is connected to the TSEN pin for temperature sensing. Charging is allowed only when the temperature is in suitable range. When a β 3380 R₂₅ 10 μ 0 NTC is used, the precise upper and lower thresholds are 45°C and 0.5°C, respectively.

Pull the TSEN to ground to disable charge function, and pull the TSEN to high voltage > 2.68V to dismiss the temperature-oriented protection function, while enables charge.

Pre-Charge Safety Time

To avoid further damage to bad battery or wrong system load, if the BAT pin voltage cannot reach 65% × V_{CHG} for over t_{SAFE} (94 minutes), the charging will be stopped.
